SentinelIQ 00 — Documentation Index

Oct 13, 2026 · @maxi

SentinelIQ is an AI-assisted SOC copilot built as a production-style project; this index lists every design document, what it decides, and where it stands.

Document map

No.	Document	What it decides	Status
01	SentinelIQ 01 — Vision & Problem Statement	The problem, vision, users, success metrics and risks	Drafted
02	SentinelIQ 02 — Product Requirements (PRD)	Functional requirements FR1–FR8 with acceptance criteria, and the early decisions	Drafted
03	SentinelIQ 03 — Non-Functional Requirements & Security	Security, reliability, performance, audit and prompt-injection controls	Drafted
04	SentinelIQ 04 — Data Strategy & Scope	Data sources, unified event schema, labels and limits	Drafted
05	Doc	Eight delivery phases, exit criteria and the document plan	Drafted
06	Doc	The interview story, README, demo script and talking points	Drafted

No.	Document	What it decides	Status
07	Doc	Components, data flow, and the reasons behind each technology choice	Drafted
08	Doc	Tables, indexes, endpoints and the ingestion contract	Drafted
09	Doc	Features, models, retrieval, prompts and the evaluation method	Drafted
10	Doc	Attack paths against SentinelIQ itself and the controls for each	Drafted
11	Doc	Test layers, CI/CD, environments, deployment and monitoring	Drafted

Reading order

1. Start with 01 (why), then 02 (what), then 03 (how well and how safely).
2. Read 04 next, because the data decides what the model and the explanations can honestly claim.
3. Use 05 to see the phase plan, and 06 to see how the finished work will be presented.
4. Documents 07 to 11 translate these decisions into design; they follow in numeric order and are now drafted.

Conventions

- **Requirement IDs:** FR for functional, SH for should-have, NFR-S and NFR-P for security and performance. Tests, commits and later documents refer to these IDs.

- **Status words:** Planned, Drafted, Reviewed, Approved. A document moves to Approved only when its open questions are closed.
- **Decisions:** every significant technology or design choice becomes a short architecture decision record (ADR) in Document 07, with the options considered and the reason for the choice.
- **Decisions:** the four early decisions (data sources, deployment, LLM provider, alert threshold) are recorded in Document 02; Document 05 shows the two that shape the delivery plan.
